

***Should Progesterone Pessaries be delivered with cold packs?***

- Progesterone Pessaries are intended to be stored below 25°C but do not require refrigeration.
- During the manufacturing process the product is exposed to temperatures exceeding 80°C with no adverse effects.
- In the event that the product is exposed to extreme temperatures during transport that results in the pessaries melting, this will be evident. Cold packs with shipping may delay the product melting but it is considered that this will not prevent it from occurring.
- If the product has melted, it will form again at normal temperatures and can then be used as intended.
